Problem 7.1:

Prove that for $f \in H^1(\mathbb{R}^d)$, $\|f\|_{H^1(\mathbb{R}^d)}$ is equivalent to

$$\left[\int_{\mathbb{R}^d} (1 + |\xi|^2) |\hat{f}(\xi)|^2 d\xi \right]^{1/2}$$

Generalize to $H^k(\mathbb{R}^d)$?

Solution Make use of Plancherel theorem. Let $f \in H^1(\mathbb{R}^d)$. Then f and Df are L^2 . The norm is

$$\|f\|_{H^1}^2 = \|f\|_{L^2}^2 + \|Df\|_{L^2}^2 = \|\hat{f}\|_{L^2}^2 + \|(Df)^\wedge\|_{L^2}^2 = \int |\hat{f}|^2 + |(Df)^\wedge|^2 = \int (1 + |\xi|^2) |\hat{f}|^2.$$

The result also generalizes to H^k . In this case, propose a norm

$$\|f\|_{H^k(\mathbb{R}^d)} = \left[\int_{\mathbb{R}^d} (1 + |\xi|^2)^k |\hat{f}(\xi)|^2 d\xi \right]^{1/2}.$$

We need to show that there exist constants $C_1, C_2 > 0$ that bound the two norms. But, this boils down to showing that there exists C_1, C_2 such that

$$C_1 (1 + x^2)^{k/2} \leq \sum_{r=0}^k x^r \leq C_2 (1 + x^2)^{k/2}.$$

Equivalently,

$$C_1 (1 + x^2)^k \leq \left(\sum_{r=0}^k x^r \right)^2 \leq C_2 (1 + x^2)^k.$$

Consider the function

$$f(x) = \frac{(\sum_{r=0}^k x^r)^2}{(1 + x^2)^k} \in C^0([0, \infty)).$$

Since $f(0) = 1$ and $\lim_{x \rightarrow \infty} f(x) = 1$, f has a maximum on $[0, \infty)$ which gives C_2 . Similarly, $g(x) = 1/f(x)$ has a maximum, giving C_1 .

Problem 7.2:

Prove that if $f \in H_0^1(0, 1)$, then there exists $C > 0$ such that $\|f\|_{L^2(0,1)} \leq C\|f'\|_{L^2(0,1)}$. Similarly, if $f \in \left\{g \in H^1(0, 1) : \int_0^1 g(x)dx = 0\right\}$?

Proof: If $f \in H_0^1(0, 1)$, then write f as $f(x) = \int_0^x f'(s) ds$. Then

$$|f(x)| = \left| \int_0^x f'(s) ds \right| \leq \int_0^x |f'(s)| ds.$$

Taking supremum w.r.t. x , we have $\|f\|_\infty \leq \int_0^1 |f'(s)| ds$. Squaring both sides,

$$\|f\|_\infty^2 \leq \left\{ \int_0^1 |f'(s)| ds \right\}^2 \leq \int_0^1 |f'(s)|^2 ds = \|f'\|_{L^2(0,1)}^2.$$

Finally,

$$\|f\|_2^2 = \int_0^1 |f|^2 \leq \|f\|_\infty^2$$

which proves the result for $C = 1$. This merely a bound, not necessarily the tightest.

For the case of zero mean, we go by contradiction. We suppose to the contrary that there exists a sequence of functions $f_k \in H^1(0, 1)$ with zero mean such that

$$\|f_k\|_{L^2} > k\|\nabla f_k\|_{L^2}.$$

Without loss of generality, let us assume that $\|f_k\|_{L^2} = 1$. Therefore,

$$\frac{1}{k} > \|\nabla f_k\|_{L^2} \rightarrow 0.$$

Now, from every bounded sequence in a Hilbert space, we can extract a weakly convergent subsequence, $f_{k_l} \rightharpoonup f$. Weak convergence in H^1 implies weak convergence of $\nabla f_k \rightharpoonup \nabla f$ in L^2 . Passing to the limit, then $\nabla f = 0$, i.e. f must be a constant. But since f must have zero mean, then $f \equiv 0$. On the other side, the Rellich-Kondrachov Theorem tells us that weak convergence in H^1 implies strong convergence $f_{k_l} \rightarrow f$ in L^2 , and therefore also in the norm. But convergence in the L^2 norm implies that $\|f\|_{L^2} = 1$, a contradiction.

Problem 7.3:

Prove that $\delta_0 \notin (H^1(\mathbb{R}^d))^*$ for $d \geq 2$, but that $\delta_0 \in (H^1(\mathbb{R}))^*$. You will need to define that δ_0 applied to $f \in H^1(\mathbb{R})$ means.

Solution For $f \in H^1(\mathbb{R})$, define the action of δ_0 as follows. First, identify a sequence $f_j \in \mathcal{D}$ converging to f . Then define the action of δ_0 using its definition on Schwartz functions, i.e. $\langle \delta_0, f \rangle = \lim_{j \rightarrow \infty} \langle \delta_0, f_j \rangle$. Indeed, for every f_j , we have

$$|\langle \delta_0, f_j \rangle| = |\langle \mathcal{F}^{-1} \mathcal{F} \delta_0, f_j \rangle| = |\langle \mathcal{F} \delta_0, \mathcal{F} f_j \rangle| = \left| \int_{\mathbb{R}^d} (2\pi)^{-d/2} \hat{f}_j(\xi) d\xi \right| = (2\pi)^{-d/2} \left| \int_{\mathbb{R}^d} \hat{f}_j(\xi) d\xi \right|$$

It follows from Cauchy-Schwarz that

$$\begin{aligned} (2\pi)^{-1/2} \left| \int_{\mathbb{R}} \hat{f}_j(\xi) d\xi \right| &\leq (2\pi)^{-1/2} \int_{\mathbb{R}} |\hat{f}_j(\xi)| \sqrt{\frac{1+|\xi|^2}{1+|\xi|^2}} d\xi \\ &\leq (2\pi)^{-1/2} \left\{ \int_{\mathbb{R}} (1+|\xi|^2) |\hat{f}_j(\xi)|^2 d\xi \right\}^{1/2} \left\{ \int_{\mathbb{R}} \frac{1}{1+|\xi|^2} d\xi \right\}^{1/2}. \end{aligned}$$

We showed earlier that the first integral is nothing more than $\|f_j\|_{H^1(\mathbb{R})}$ which converges to $\|f\|_{H^1(\mathbb{R})}$. By performing change of var. on the second integral, we see that

$$\int_{\mathbb{R}} \frac{1}{1+|\xi|^2} d\xi \sim d\omega_d \int_{\mathbb{R}} \frac{r^{d-1}}{1+r^2} dr$$

which converges only when $1-d+2 > 1$, i.e. when $d < 2$.

To show that δ_0 is not a member of the dual space for $d > 1$, we compute its norm in the dual space. First, the dual of $H^1(\mathbb{R}^d)$ is $H^{-1}(\mathbb{R}^d)$. Then, we have the norm

$$\|\delta_0\|_{H^{-1}(\mathbb{R}^d)} = \left\{ \int_{\mathbb{R}^d} (1+|\xi|^2)^{-1} |\hat{\delta}_0|^2 d\xi \right\}^{1/2} = (2\pi)^{-d/2} \left\{ \int_{\mathbb{R}^d} \frac{1}{1+|\xi|^2} d\xi \right\}^{1/2}.$$

Performing the same change of variables, we again see that the integral is similar to

$$\int_{\mathbb{R}} \frac{1}{1+|\xi|^2} d\xi \sim d\omega_d \int_{\mathbb{R}} \frac{r^{d-1}}{1+r^2} dr$$

and also converges only when $d < 2$.

Problem 7.4:

Prove that $H^1(0, 1)$ is continuously embedded in $C_B(0, 1)$, the set of bounded and continuous functions on $(0, 1)$.

Solution Take a Cauchy sequence of smooth functions $f_j \in H^1(0, 1) \cap C^\infty([0, 1])$. Let now $g := f_j - f_k$. Notice that by Cauchy-Schwarz

$$\left| \int_0^1 g \right| \leq \sqrt{\int_0^1 1^2} \sqrt{\int_0^1 g^2} = 1 \|g\|_{L^2} \leq \|g\|_{H^1}.$$

Furthermore, by the mean value theorem, g attains its average, $m = \int_0^1 g$ at some point x_0 . Then

$$|g(x) - m| \leq \sqrt{|x - x_0|} \|g\|_{H^1} \leq \|g\|_{H^1}.$$

Finally, triangle inequality tells us

$$\|g\|_\infty \leq m + \|g\|_{H^1} \leq 2\|g\|_{H^1}.$$

So, if f_j is Cauchy in $H^1(0, 1) \cap C^\infty([0, 1])$, then it is Cauchy in $C_B(0, 1)$ and therefore converges. The inclusion map is therefore sequentially continuous and therefore continuous.
